Current public transit ramps are too steep or unreliable, creating unsafe conditions for individuals with mobility challenges, causing barriers in their use of public transportation. TeleSlope solves this with a ramp designed to accommodate all curb heights, through self-leveling, made from lightweight yet durable materials. It deploys quickly, enhances safety, and combines compact storage with adaptability, overall improving the boarding efficiency. Our business model focuses on partnering with transit agencies, beginning in the GTA, then expanding across Canada. TeleSlope is accessible and sustainable, designed for a more inclusive future in transportation.
